AUTHOR: Kosmachev, V. P.

TITLE: On the Problem of Electrolytical Gold and Silver Deposition From Cyanide Solutions

PERIODICAL: Sb. nauchn. tr. Kazakhsk. gorno-metallurg. in-ta, 1959, No. 20,
pp. 365-376

TEXT: The author studied basic characteristics of the process of extracting Ag and Au from cyanide solutions. The potentials of Ag deposition out of cyanide solutions on Pb- and Cu-cathodes are similar and equal to 0.6 v and on Hg-cathodes - 0.5 v; potentials of Au deposition on Pb- and Cu-cathodes are 1.1 v. Without stirring the solution, 100% deposition of Ag is obtained within 60 minutes and of Au within 120 minutes. When stirring and heating up to 60°C, a 100% deposition of Ag and Au can be obtained within 45 minutes, whereas during carburizing 2 - 3 hours are spent. Current efficiency of Ag is 70 - 80% at $D_{cath} = 0.046$ amp/dm². Studies of the process of anode oxidation of amalgams showed that full separation of Au from other impurities can be attained. Z. Selov'yeva

down the development 20-40%. For egg-laying,
the females prefer open lots covered with bushes.
Middle-aged and ripe pine plantations are readily
populated to a plentitude of 0.4 - 0.6. The fe-
males avoid wet soils. The distributions of the
larvae in the soil is determined by the temper-
ature, humidity, aeration and conditions of
feeding. In the autumn, the larvae descend to
the depth of 100-150 cm., but in the active
feeding condition they prefer to stay in the up-
per layer of the soil. The eastern limit of the
West May beetle is determined by the low winter
temperatures which kill the larvae of this species,
which winter at a small depth (20-50 cm). Briefer
data are given for other species of the beetles.

Title : Measuring the masses by impulse and ionization and the spectra of the impulses of various particles of cosmic radiation at sea level

Periodical : Dok. AN SSSR 102/1, 57-60, May 1, 1955

Abstract : A new method for measuring the masses of particles of cosmic radiation is described. Basically, the new method consists of measuring impulses of ionization produced by a cosmic radiation particle in the free mass of the 4-layer proportional counter inserted between the magnetic poles of the instrument. The complete spectra of nucleous-active particles were constructed with the help of this new method. Three USSR references (1951-1954). Tables; diagrams.

RESEARCH INTO THE NATURE AND SPECTRA OF
PARTICLES PRODUCED BY HIGH ENERGY NUCLEONS

A. I. Alikhanov, A. V. Khriyan, V. K. Kosmachevsky
V. L. Avakyan, K. S. Egtyan, Yu. P. Korotkov, N. A.
Nalbandyan

The nature and the momentum spectra of secondary particles produced in lead by fast cosmic nucleons were studied at an altitude of 3,250 m. above sea level by means of a magnetic mass-spectrometer, five-layer proportional counter and five-layer scintillation counter.

The momentum spectra of π^- -mesons, K-mesons, protons and neutrons, generated by the charged and neutral components of cosmic radiation, are presented.

The spectra of π^+ -mesons produced by neutrons do not differ from the spectra of -mesons produced by fast charged particles. The $N^+_{\pi^+}/N^-_{\pi^-}$ ratio for π^- -mesons generated by protons differs from that for π^+ -mesons generated by neutrons.

Among the products of stars with momenta up to 720 Mev/c, the number of K-mesons is of the order of 10% of the π^- -mesons. In the 720-1,000 Mev/c range, $N_K/N_p > 0.2$.

In the momentum range up to 1,000 Mev/c, an increase in the number of K-mesons is observed with increase in momentum. An evaluation of the σ_N/σ_p ratio was undertaken where σ_N, σ_p are the cross sections of K - meson production by neutrons and protons.

Data are presented on the number of neutrons and protons of different energies

In the momentum range up to 1,000 Mev/c, an increase in the number of K-mesons is observed with increase in momentum. An evaluation of the n/p ratio was undertaken where n , p are the cross sections of K-meson production by neutrons and protons.

Data are presented on the number of neutrons and protons of different energies in cosmic radiation flux at an altitude of 3,250 metres above sea level.

report presented at the International Cosmic Ray Conference, Moscow, 6-11 July 1959.

high-energy nucleons

PERIODICAL: Referativnyy zhurnal Fizika, no. 10, 1961, 97, abstract 10B507 ("Tr.
Mezhdunar. konferentsii po kosmich. lucham, 1959, v. 1", Moscow, AN
SSSR, 1960, 183 - 187)

TEXT: The authors present the results of investigating particles with mo-
menta up to 900 Mev/c produced in lead by high-energy nucleons of cosmic radia-
tion at an altitude of 3,200 m above sea level (the Aragats mountain, Armenia).
The ionizing capability of individual particles was determined with an average
accuracy of $\pm 14\%$ by means of a gas counter and of $\pm 10\%$ by means of five scin-
tillation counters.

Title : The Study of the Physical Chemical Properties of Herzegovinian Cotton and its Behaviour in a Treatment Process.

Orig Pub: Tekstilna ind., 1957, 5, No. 12, 425-427.

Abstract: A study was made on the chemical composition of the Herzegovinian cotton in a ripe and semi-ripe state, the fiber and seed yield, the fiber length and the behaviour of cotton in processes of boiling, bleaching and dyeing. The Herzegovinian cotton contains 88.7% of cellulose, its fiber length and amount of impurities make it suitable for the production of coarse cotton fabrics and it is easily dyed by direct dyes.

TITLE: Methodological Teaching Principles of the Subject
"Processes and Installation of the Chemical Industry"
in Professional Schools (Metodološki principi nastave
predmeta "Procesi i aparati kemijske industrije" u
stručnim školama).

PERIODICAL: Kemija u industriji, 1959, Nr 4, pp 95-96 (YUG)

ABSTRACT: The article emphasizes the need to introduce new
teaching methods for the subject "Processes and In-
stallations of the Chemical Industry". Since purely
descriptive teaching is not sufficient and practical
teaching by visiting individual plants inconvenient in
most cases, new methods should be introduced which
would include theoretical lectures on basic technolo-
gical processes and practical demonstrations on models

Card 1/2

Methodological Teaching Principles of the Subject "Processes and
Installation of the Chemical Industry" in Professional Schools

of standard equipment and installations used in these
processes. Suggestions have been made on the type
of basic technological processes which should be taught,
i.e. raw materials processing, such as grinding, sieving,
etc., thermal processing, hydromechanical processing
and special processing methods which are not specialized,
but do not fall into one of the three standard types
mentioned.

Kouček, Ladislav. On certain sequences of sets of points
on a circle. Casopis Pst. Mat. 80 (1955), 299-307.
(Czech)

From a set $S^{(1)} = \{A_0^{(1)}, A_1^{(1)}, \dots, A_{n-1}^{(1)}\}$ of n points arranged, in this order, on a circle, a sequence of similar sets $S^{(k)} = \{A_0^{(k)}, A_1^{(k)}, \dots, A_{n-1}^{(k)}\}$ is defined recursively as follows: the i th point $A_i^{(k+1)}$ of $S^{(k+1)}$ divides the arc $A_{i-1}^{(k)}A_{i+1}^{(k)}$ in the ratio $b : (1-b)$, where $0 < b < 1$ ($A_{n-1}^{(k)} = A_0^{(k)}$). The author proves: (i) if $a_1^{(k)}$ is the angle subtended by $A_1^{(k)}A_{n-1}^{(k)}$ at the centre of the circle, then $\lim_{k \rightarrow \infty} a_1^{(k)} = 2\pi/n$; (ii) if b is a rational number p/q (p, q relatively prime), then the $A_i^{(k)}$ have exactly mq limit points, equally spaced round the circle; and (iii) if b is irrational, then every point on the circle is a limit point. This generalizes a result by J. Brejcha who considered the case $n=4$, $b=\frac{1}{3}$ [Prace Moravskoslezské Akad. Ved. Prírod., Brno 24 (1952), 347-358; MR 16, 277].

Kosmák, Ladislav. Une note sur les fonctions convexes. Czechoslovak Math. J., v. 6(31) (1956), 420-425. (Russian summary)

Let f be a function continuous on the segment $\langle a, b \rangle$ and let $P_{\langle a,b \rangle}$ be the polynomial function of second degree which is the best approximation (supremum norm) to f on $\langle a, b \rangle$. Let

$$E_{\langle a,b \rangle} = \max_{a \leq x \leq b} |f(x) - P_{\langle a,b \rangle}(x)|.$$

If $f \neq P_{\langle a,b \rangle}$ on $\langle a, b \rangle$ let $m_{\langle a,b \rangle}$ be the maximum number of elements in a finite sequence

$$a \leq \xi_1 < \xi_2 < \dots < \xi_k$$

such that $|f(\xi_i) - P_{\langle a,b \rangle}(\xi_i)| = E_{\langle a,b \rangle}$ and $f(\xi_i) - P_{\langle a,b \rangle}(\xi_i)$ alternates in sign with i . If $f = P_{\langle a,b \rangle}$ in $\langle a, b \rangle$ let $m_{\langle a,b \rangle}$ be

3. The author announces the following theorem. The function $f(x)$ defined and continuous on $\langle a, b \rangle$ is convex if and only if for every subsegment, $\langle \alpha, \beta \rangle$, of $\langle a, b \rangle$ one has

$$E_{\langle \alpha,\beta \rangle} \leq \frac{(\beta - \alpha)^3}{2(m_{\langle \alpha,\beta \rangle} - 1)^2} c_{\langle \alpha,\beta \rangle},$$

where $c_{\langle \alpha,\beta \rangle}$ is the coefficient of x^2 in $P_{\langle \alpha,\beta \rangle}$.

(In making the direct proof the author assumes that at a certain point x_1 of maximum distance the derivative of f exists and equals $P_{\langle a,b \rangle}'(x_1)$. The reviewer has not verified that this derivative exists although the author states that it is easily seen. It seems likely that a modification of the proof may be made even if the derivative does not exist.)

1.6. THE THEORY OF APPROXIMATION

J. Kočmář

Matematika v českých zemích, Vol. 17, No. 6, 325-330 (1954). In Czech.
The uniform approximation is defined and its properties
are stated in a number of theorems (without proofs). It is
shown that the functions of the class $C(a, b)$, which are con-
tinuous and single-valued within a closed interval from a to b ,
can be approximated in a uniform manner either by the Bern-
oulli algebraic polynomials or by the De la Valée-Poussin
trigonometric polynomials. The problem of optimum uniform
approximation is shown to lead, for some functions of the class
 $C(a, b)$, to the Chebyshev polynomials. The quadratic approxi-
mation is considered in terms of the n -dimensional geometry,
the approximated functions being of the class L^2 . Here the
approximation is carried out by orthogonal systems such as:
trigonometric functions, Legendre, Chebyshev, Laguerre and
Hermite polynomials and Bessel functions.

 Abstract no.8312. Uch.zap.Irkutskiy finans.-ekon.in-t,
 1958, vyp.7, 3-51

TEXT: The principal idea of the article consists in the following.
 Given e.g. the algebraic equation of fourth degree with real coefficients:
 $x^4 + p_1x^3 + p_2x^2 + p_3x + p_4 = 0$. Let this equation in fancy be replaced by:
 $(x^2 + ax + b)(x^2 + a_1x + b_1) = 0$. Putting each of these two factors equal to y
 then one obtains the equations of two parabolas: $y = x^2 + ax + b$ and
 $y = x^2 + a_1x + b_1$. But if the given equation is replaced by the equation
 $-(x^2 + ax + b)(x^2 + a_1x + b_1) = 0$ and each of the factors is put equal to y^2
 Card 1/2

88895

S/044/60/000/007/052/058
C111/C222

On the question on the general...
then one obtains two equations: $y^2 = -(x^2 + ax + b)$ (equation of a circle)
and $y^2 = x^2 + a_1 x + b_1$ (equation of a hyperbola).

With the aid of this scheme, basing on numerical examples the author gives a rule for the determination of the abscissa of the center and the square of the radius of the mentioned circle (in the case of complex roots the radius is purely imaginary); that gives the possibility to write the polynomial $x^2 + ax + b$. In some places the representation is confused and unintelligible. There are inaccuracies.

Editorial Work in the Preparation of Maps on a Scale of
1 : 25000 at the Vostochno-Sibirskoye Aerogeodetical Enterprise
(Redaktsionnaya rabota pri sotsdaniil kart mashtaba 1 : 25000
v Vostochno-Sibirskom AGP)

PERIODICAL: Geodeziya i kartografiya, 1959, Nr 4, pp 24-30 (USSR)

ABSTRACT:

In 1950 the Vostochno-Sibirskoye aerogeodesicheskoye predpriyatiye Vostochno-Sibirskoye Aerogeodetical Enterprise) started the topographical survey on a scale of 1: 25000. The first sections of these maps showed big errors as the work was carried out without an editor. The further sections are growing better. For this purpose, technical training was introduced in workshops and for the field squads. Besides, the students (candidates for diploma) of the Irkutskiy universitet imeni Zhdanova (Irkutsk University imeni Zhdanov), who worked as trainers in the service, developed concrete types of representation for the characteristic landscapes. Since 1953, technical conferences of the editors have been taking place every year in winter. On the basis of editorial instructions by the editors of the field squads and the instructions of the GUCK,

Card 1/3

SOV/6-59-4-8/20

the chief editor gives the editorial instructions for the whole service. In the field work, the editors take care that the instructions are followed by the topographers. In the work of map composition, the editorial plan is set up by the map editor or by the chief editor. The editing method depends on the methods of topographical survey and of map composition. The different methods possible are described in short. The activity of a field editor in the East Siberia Aerogeodetical Service is then described in detail here. The area of Siberia is poorly described in publications, and the regions to be cartographed are therefore mainly studied by the editor on the map on a scale of 1 : 100000. In advance, he sets up a scheme for the photographic flights. He compares the data of the photographic flights with the phenological and hydro-meteorological data. Then he sets up the scheme of landscapes and the hydrographic scheme. One of the most difficult tasks is the coordination of the water levels. There is a lack of water gauge stations; levels vary between 3 and 8 m in height and 2 - 3 km in length; the longitudinal profile of the rivers is mostly irregular. The major part of these regions are swampy (mari and poamy), the vegetation in them comprises up

Card 2/3

Editorial Work in the Preparation of Maps on a Scale of 1 : 25000

SOV/6-59-4-8/20

to 11 kinds of plants. The editors, in common with the students, have established the definitions and marks for the different kinds and stages of these swamps and for the different plants. They are described in short here and shown in figure 3. In connection with forest fires, uprootings and the subsequent return to a wild state, the most different varieties of landscapes arise. Recommendations for representing the fire places and uprootings are given here. V. P. Aref'yeva, Editor, suggested a procedure for distributing marks for rocky areas to represent the exit places of mother rock. V. A. Drushinina, Editor, worked out this procedure (Fig 4). There are 4 figures.

TITLE:

Cols and their representation on the topographic map on
a scale of 1 : 25,000

PERIODICAL:

Geodeziya i kartografiya, no. 2, 1961, 27-30

TEXT: The author deals only with those cols which she studied in the areas of the Vostochno-Sibirskoye aerogeodezicheskoye predpriyatiye (East Siberian Geodetical Enterprise). She discusses the representation of cols on large-scale topographic maps and criticizes mechanical drawing. A survey of the various forms of cols is given by means of figures. They can be divided into symmetrical and asymmetrical forms. The former comprise cols with symmetric position of the same contour lines on opposite sides, the latter comprise those with asymmetric position of the contour lines. The symmetric cols were formed on basic rocks with homogeneous geological structure under the action of erosion processes, mainly processes of progressive erosion. They are either narrow or wide (width signifying the distance between the high sides of the col), or long or
